

Top 10 User Mistakes with Static Analysis

■
Sate IV
March 2012

- Founded in 1987
- 27+ Patents for automated quality processes
- Build quality into the process
- Static Analysis tools since 1994

- Variety of methods

- Peer Review / Manual Code Review / Code Inspection
- Pattern-based code scanners
- Flow-based code scanners
- Metrics-based code scanners
- Compiler / build output

10) Developers not included in process evolution

- Developer Insights
 - Rules / Issues drive need
 - Workflow
 - Usability
 - Correctness / Noise
- Will our engineers really adopt it and use it?
- Is this a long-term solution?

- “Static analysis is a pain”
- False positives has varying definitions
 - I don't like it
 - It was wrong

- True false positives generally rule deficiency
- Context
 - Does this apply here and now?
 - In-code suppressions to document decision

- False positives are inevitable
- Finds real bugs
- Flow analysis is not comprehensive

9) Wrong expectations

- Why do static analysis?
 - Because it's the right thing?
 - Increase quality?
 - Decrease costs?
 - Reduce development time?
- Flow analysis is enough
- When will it pay-off?
- How can I tell it's paying off?

8) Taking an audit approach

- Running SA on all your code (Don't)
- It's all about the reports (Or is it?)

- 7) Starting with too many rules
- Static Analysis is about process
 - It's incremental
 - Avoid biting off more than you can chew
 - Avoid any rule you won't stop the build for

- Same set of rules for everyone
- Small set of rules
- Less rules that are followed is better than more that are not
- If you wouldn't fix it, don't check for it

6) Workflow integration

- Has to work with your development UI
- Same configuration for desktop and server
- Minimize negative impact
- Minimize time to find / fix violations

Results within IDE

3 Check-In

2 Directly access line of code to fix

```
233 }
234 }
235 )
236 private String testXMLSerialization(File testFile, boolean d
237 Object origTest = openProject(new BaseFile(testFile), fa
238 BaseFile newFile = saveProject(origTest, testFile.getNam
239 try {
240 openProject(newFile, false);
241 // We are not checking project equality, because all
242 // do not have equals() implemented. Also, using ch
243 // when serializing the old and new tests are differ
244 // written for both objects are equal.
245 } catch (Exception e) {
246 return "Caught exception reading serialized xml: "
247 } finally {
248 if (deleteNewFile) {
249 newFile.getFile().delete();
250 }
251 return null;
252 }
253 private boolean skipFile(File testFile) throws Exception {
254 String path = testFile.getCanonicalPath();
255 path = path.replace('\\', '/');
256 }
```

1 Results delivered as uniform view within IDE

- [28] Fix Static Analysis Violations
- [9] baranov
- [11] jakubiak
- [5] rjaamour
- [2] truong
- [1] com.parasoft.xtest.common.web.ui.tool.messaging
- [1] MQRFH2PscConfigurationEditor.java
- [1] Avoid NullPointerException (BD.EXCEPT.NP-1)
- [Line 519] "Item" may possibly be null
- MQRFH2PscConfigurationEditor.java (515): selectionIndices = _topicsTableEditor.getSelectionIndices()
- AddRemoveSelectableTableEditor.java (163): _tableViewer.getTableViewUI()
- AddRemoveSelectableTableEditor.java (163): return _tableViewer.getTableViewUI().getSelectionIndices();
- MQRFH2PscConfigurationEditor.java (516): if (selectionIndices != null && selectionIndices.length == 1) {
- MQRFH2PscConfigurationEditor.java (517): _topicsTableEditor.getItemAt()
- AddRemoveSelectableTableEditor.java (159): _tableViewer.getItemAt(index)

5) Lack of sufficient training

- How to install the tool
- How to configure the tool
- How to setup the build
- How to run the tool
- How to mitigate violations
- How/when to suppress

4) No defined process

- Developers are not necessarily process experts
- Process should minimize impact of SA
- Consistent for teams and projects
- Vetted in a pilot project

3) No automated process enforcement

- Reduce effort
- Consistency
- Compliance

2) Lack of a clear policy

- What teams need to do SA?
- What projects require SA?
- What rules are required?
- What amount of compliance?
- When can you suppress?
- How to handle legacy code?
- Do you ship with SA violations?

1) Lack of management buy-in

- Requirements
- Allowed time
- Understanding of the ROI
- Enforcement

- 10) Developers not included in process evolution
- 9) Wrong expectations
- 8) Taking an audit approach
- 7) Starting with too many rules
- 6) Workflow integration
- 5) Lack of sufficient training
- 4) No defined process
- 3) No automated process enforcement
- 2) Lack of a clear policy
- 1) Lack of management buy-in

- Wrong Tool
- Wrong Process
 - Email reports
 - Blocking
 - Painful CI workflow
- Wrong Rules
 - Unimportant rules
 - Too many rules
- Wrong Code
 - Legacy strategy
 - Don't test what you won't / can't change

- Lack of management buy-in
 - The edict
 - Allowed time & budget
- Lack of development buy-in
 - Willful non-compliance
- Lack of training
